Volume IV - Fourier Amplitude Spectra

Parts J, K, L, and M - Accelerograms IJ141 through IJ150,  
IK157 through IK160, IL166 through IL175, and  
IM176 through IM184

Report No. EERL 74-102

A Report on Research Conducted Under a Grant  
from the National Science Foundation

Pasadena, California

May, 1974

## ABSTRACT

This is one of a series of reports presenting Fourier amplitude spectra for earthquake ground motions and for structural response accelerations. Volume IV, Part A, Report No. EERL 72-100, included an introduction summarizing Fourier spectrum techniques in earthquake engineering as a background to the use of the data. For each earthquake accelerogram, two spectrum plots are given - a Fourier amplitude spectrum versus frequency on a linear scale and a log-spectrum, log-frequency plot. In this Volume IV series, Fourier amplitude spectra will be given for all corrected accelerograms, including building response measurements. The corrected records analyzed in this report, Volume IV, Parts J, K, L, and M, appeared in Volume II, Parts J and K, Report No. EERL 74-52, and Volume II, Parts L and M, Report No. EERL 74-53. Their uncorrected versions were published in Volume I, Part J, Report No. EERL 72-23; Volume I, Part K, Report No. EERL 72-24; Volume I, Part L, Report No. EERL 72-25; and Volume I, Part M, Report No. EERL 72-26.

## PREFACE TO VOLUME IV, PARTS J, K, L, AND M\*

This report, Volume IV, Parts J, K, L, and M, Report No. EERL 74-102, is part of the Volume IV series presenting Fourier spectrum curves calculated from corrected strong-motion accelerograms including measurements in structures as well as at ground sites. We continue here with records from the San Fernando, California, earthquake of February 9, 1971. The analysis of records from this earthquake appeared first in Volume IV, Part C, Report No. EERL 73-101, and this report presents the spectra from the following locations:

1. Lake Hughes Array, Stations 1, 4, 9, 12 (4 records)
2. 15107 Vanowen Street, Los Angeles (3 records)
3. 616 S. Normandie Avenue, Los Angeles (3 records)
4. 420 S. Grand Avenue, Los Angeles (2 records)
5. 750 Garland Avenue, Los Angeles (2 records)
6. 3838 Lankershim Boulevard, Los Angeles (3 records)
7. 945 Tiverton Avenue, Los Angeles (3 records)
8. Southern California Edison Nuclear Power Plant, San Onofre
9. 1888 Century Park East, Los Angeles (4 records)
10. 1150 S. Hill Street, Los Angeles (3 records)
11. Tehachapi Pumping Plant, Grapevine
12. 4000 W. Chapman Avenue (or 1 City Boulevard), Orange (3 records)
13. 6074 Park Drive, Wrightwood (2 records)

The uncorrected versions of these records appeared in Volume I, Parts J, K, L, and M, Report Nos. EERL 72-23, 72-24, 72-25, and 72-26, and the plotted corrected accelerations, velocities, and displacements were included in Volume II, Parts J and K, Report No. EERL 74-52, and Volume II, Parts L and M, Report No. EERL 74-53. These Volume II corrections included a long period cut-off of 8 seconds

---

\* For reasons of economy and convenience in the size of the reports, it has been thought desirable to combine four parts into one report.

for all the 70-mm film records in this issue instead of the standard cut-off period of approximately 15 seconds. Twelve inch paper records from the following locations received the standard 15 second filtering:

1. Lake Hughes Array, Stations 1, 9, 12 (3 records)
2. 945 Tiverton Avenue, Los Angeles (2 records)
3. Southern California Edison Nuclear Power Plant,  
San Onofre
4. Tehachapi Pumping Plant, Grapevine

The results published here reflect this altered low-frequency limit most clearly in the log-log plots where the Fourier amplitude spectrum in general commences falling off at a frequency of  $f = 0.125$  cps ( $\log f = -0.90$ ) instead of at  $f = 0.07$  cps ( $\log f = -1.15$ ).

A number of very low amplitude accelerograms have been eliminated from the processing of Volume II and on, reflecting the expectation that the resulting displacements would be dominated by noise. Included in this group of accelerograms, and therefore eliminated from this issue, are the following:

1. J151, J152, Terminus Dam
2. K153-K156, Maricopa Array, Stations 1-4
3. K161-K165, Isabella Dam.

## NOTES ON THE VOLUME IV SERIES

Description of the Four Volumes of the Project. The series of reports in Volume I present "uncorrected" digitized and plotted strong-motion earthquake accelerograph data, while the series in Volume II present corrected digitized data prepared so that the maximum information over the widest practicable frequency range would be available. The corrections include long period filtering ensuring to the greatest extent possible a uniform type of baseline adjustment and an instrument correction to account for the high frequency response characteristics of the accelerograph transducer.

The Volume III series presents earthquake response spectrum curves calculated from the corrected accelerograms of Volume II, while the Volume IV series contains Fourier amplitude spectra calculated by the Fast Fourier Transform algorithm. An extensive introduction was prepared for Volume IV, Part A, Report No. EERL 72-100, where details of the methods used can be found together with examples of applications to various problems of earthquake engineering and strong-motion seismology. That introduction should also serve as a basic summary of background information for users of the data.

Contents of the Various Parts. The specific records whose "uncorrected" digitized versions appeared in Part A of Volume I are included subsequently with their analyses in Part A of Volume II, III, and IV. This arrangement has been maintained throughout the whole series. In Part C of Volume IV, Report No. EERL 73-101, we began the presentation of Fourier spectra analysis for the unusually important series of accelerograms obtained during the San Fernando

earthquake of February 9, 1971. These are expected to be concluded with Part S. The reports following Part S will continue with the original selection of approximately one hundred strong-motion records whose presentation started in Parts A and B.

Component Directions. A description of the component direction nomenclature for the records was given in Volume II, Part B, Report No. EERL 72-50. Consistent with this, the component direction where it appears in this report refers to the direction of the transducer pendulum motion for the trace to be deflected "up" on the record when viewed in the normal way with time increasing from left to right. The direction of true ground acceleration is opposite to this pendulum motion. The spectral calculations of Volume IV, however, are concerned with the amplitude spectrum only and the particular component sense is thus immaterial.

Assessment of Long Period Errors. A separate section in Volume II, Part G, Report No. EERL 73-52, entitled "Current Assessment of Long Period Errors" describes the results of a recent investigation of long period displacements calculated from recorded accelerations. During the course of this study it became evident that the procedures for preparation of 70-mm and, to a lesser extent, 35-mm film records from the San Fernando earthquake of February 9, 1971, introduced spurious excitations at periods close to the duration of the sectional enlargements. These effects have been removed from all of the 70- and 35-mm film records by filtering with a long period limit of 8 seconds rather than the standard cut-off period of 16 seconds in the Volume II correction procedure. The following list of

Caltech reference numbers indicates the records from the San Fernando earthquake included in Volume I, Parts C through S, that have been processed with the cut-off period of 8 seconds:

Parts G, H, I, K, N, Q, R, S: All records in these parts.

Part J: Records J142 and J145 through J150.

Part L: Records L166, L167, L168; L172 through L175.

Part M: Records M176, M177, M178; M180 through M184.

Part O: Records O198 through O201; O206, O208, O210.

Part P: Records P231 and P232.

A decision was also made at the same time to eliminate a number of very low amplitude accelerograms from further processing (Volume II and on) reflecting the expectation that the resulting displacement records will be dominated by noise. Their Caltech reference numbers are as follows:

H127; I140; J151, J152; K153 through K156, K161 through K165; O202, O203, O209, O211; P224 through P230.

Description of the Figures and Tables. For each component in the following pages the Fourier amplitude spectrum is presented in two forms - a linear plot and a log-log plot. Details concerning identification are given at the top of each plot. The second line gives the name, date, and time of occurrence of the earthquake; the third line is comprised of two labels, the observation station and the component processed. The Roman numeral "IV" in the first identification

label indicates that the results pertain to the fourth stage of data processing, i.e., Volume IV of Fourier spectra of accelerogram records already corrected for baseline adjustment and instrument response. The letter following the Roman numerals indicates the part of Volume II to which the processed record belongs. The three-digit number completing the first label is the Caltech Reference Number for the given earthquake record in Volume I, right-adjusted in a three-digit numerical field. The second label is a string of three numbers separated by periods; the first number gives the year in which the earthquake occurred; the second is the serial number of the record as it was received at the Caltech Earthquake Engineering Research Laboratory during that year; and the last number indicates whether it was a main event or an aftershock (sequentially numbered, the main event starting from zero). On the linear spectrum plot, the data lying above the 95 percent confidence level may be considered relevant to that degree. The spectra have been plotted up to a frequency of 25 cyc/sec on linear and logarithmic scales, corresponding to the capabilities of the instrumentation and data processing methods used.

Frequency Transfer Functions. This report presents many spectra of accelerograms recorded simultaneously at different locations in the same structure, for example, the basement, mid-height, and roof levels of a tall building. At present it is planned to calculate frequency transfer functions involving smoothing and calculating the ratio of two such spectra in supplementary reports.

Acknowledgments. The cooperative efforts of many people are essential in the preparation of a series of reports of this kind and we have been fortunate in the quality of staff that has carried out the various details with special care and attention. We should like to express our appreciation to Mr. Vincent Lee for this assistance with many details of computer programming, to Miss Barbara Turner and Miss Sharon Vedrode for the care taken over typing and editing, to the staff of the Willis H. Booth Computing Center for their continued help with all aspects of the computing process, and to the staff of the Caltech Graphic Arts Facilities for very efficient work on publication details. The whole project has been made possible by the continued support of the National Science Foundation, supplemented in an important way by contributions from the Earthquake Research Affiliates Program of the California Institute of Technology.
